Week 4 (One on One):

Problem 1

Let's create a simple page to display the weather, it should have:

- the date & time
- the temperature
- description of the weather

Please use one of these 3 backgrounds:

```
http://webweu.se/ab33/Bilder/WPS/Artistic/Rain-Artistic-Wallpaper.jpg
http://www.photofurl.com/wp-content/uploads/2008/11/beautiful_mountain_wallpaper.jpg
http://www.skringers.com/wp-content/uploads/Free-Desktop-Wallpaper-Beach-Scenes-Sunny-Beach.jpg
```

You should make it so that I can change the background of the web page by changing an attribute of the `body` tag in the HTML rather than the CSS.

Additionally, please:

- center all text and make it white
- make the temperature very large compared to all the rest of the text
- have space above and below the temperature
- Use a [sans-serif](#) font

Problem 2

Create a file called `api.rb` that pulls in the weather from [Yahoo](#) or [OpenWeather](#).

Please output to the command line:

- the date
- temperature
- description of the weather

Bonus: Open your file and change the value of the date, temp & condition so when it loads it has the data from the last time
